

A. PRM held-out confusion matrix (acc 0.914)

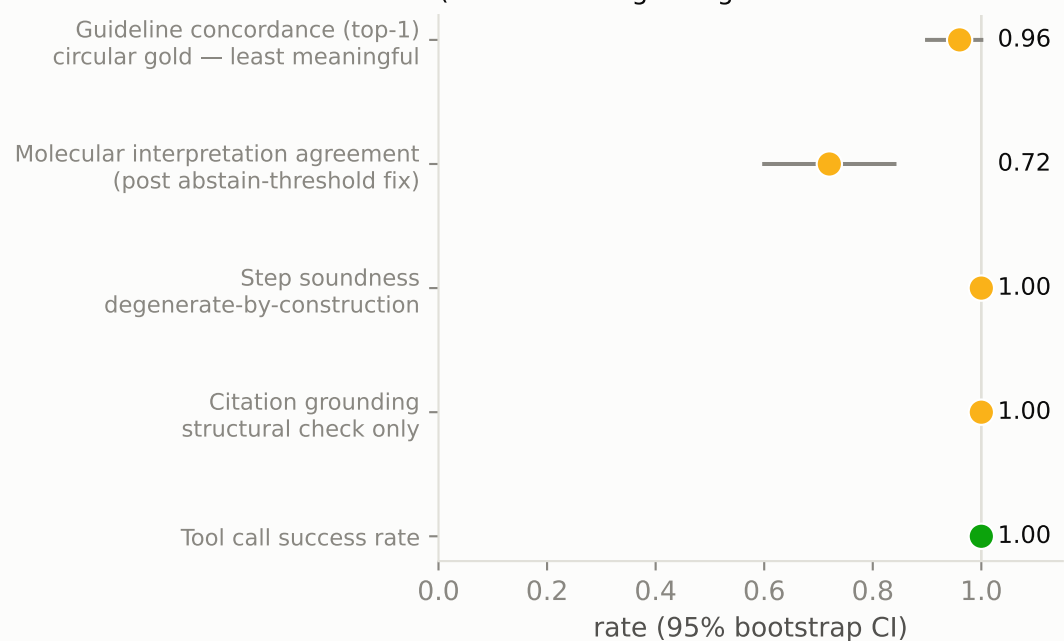

B. Calibration — ECE 0.304, Brier 0.141

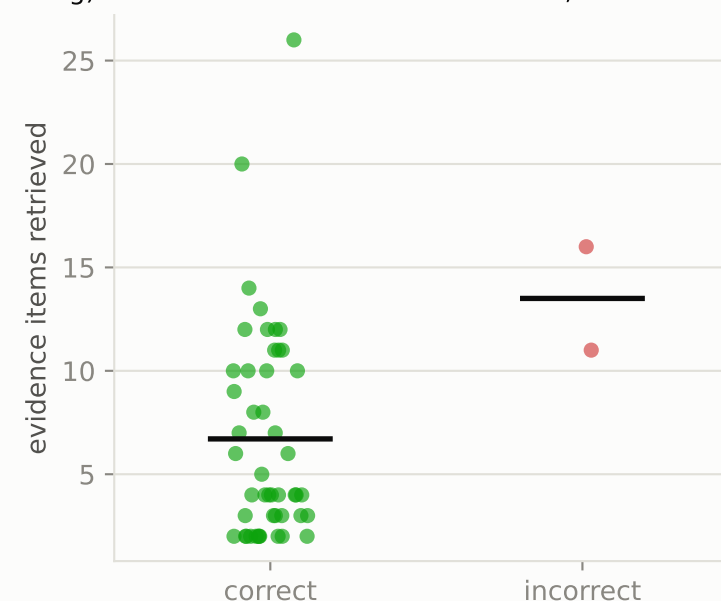

C. Deferral: accuracy vs coverage as abstain threshold τ moves (monotone, 95% CI band)

D. Headline metrics with bootstrap 95% CIs (color = read: green good · amber caveated · red concerning)

E. Information gathering — $r = -0.256$ ($p = 0.073$) more evidence tracks with harder, not better-informed, cases

F. Abstention decision, post-fix (14/38 residual: guideline tier alone still clears the threshold — a gold-standard definition gap)
